# redmap

SPOT. LOG. MAP.

**Redmap** (Range Extension Database and Mapping Project) captures information that will help us assess how our marine ecosystems might be changing.

**Redmap** invites recreational and commercial divers, fishers, snorkelers, scientists and members of the public to **SPOT – LOG – MAP** any marine species which are not usually seen in their local area.

This ID sheet gives just a few examples of species which might be on the move – if you see any out today, remember to log them with **Redmap!**
