redmap

SPOT. LOG. MAP.

Redmap (Range Extension Database and Mapping Project) captures information that will help us assess how our marine ecosystems might be changing.

Redmap invites recreational and commercial divers, fishers, snorkelers, scientists and members of the public to **SPOT – LOG – MAP** any marine species which are not usually seen in their local area.

This ID sheet gives just a few examples of species which might be on the move – if you see any out today, remember to log them with **Redmap!**
